Documents cited in the International Search Report:

D1: US 2001 042 789 A1 D2: US 5 593 017 A

The invention relates to a device for recognising a container by means of a marking provided on its surface. A problem associated with systems for recognising container markings is that the surface of the container or the marking may be irregular. In order to eliminate these problems, the invention uses a system comprising one imager (camera) and an arrangement of mirrors enabling the imager to obtain two images from different directions relative to the marking.

After the amendments of the claims, wherein the invention has been clarified by specifying the positions of the mirrors relative to the imager, the documents cited in the International Search Report now only represent the general state of the art.

The invention defined in claims 1-7 is therefore not disclosed by any of these documents.

The cited prior art does not give any indication that would lead a person skilled in the art to the claimed device for recognising a container. Therefore, the claimed invention is not obvious to a person skilled in the art.

Accordingly, the invention defined in claims 1-7 is novel and is considered to involve an inventive step. The invention is industrially applicable.

International Patent Application No: PCT/NO03/00213 - Tomra Systems ASA, et al.

Referring to the International Search Report (ISR) dated 12 December 2003, we hereby submit amended claims (enclosed) supported by the following comments and observations.

The ISR cites US 2001042789 A1 as being of particular relevance regarding novelty and inventive step.

The cited publication discloses (figure 3) a device with two transparent scanning surfaces (windows) at an angle to one another, and two fixed mirrors and one moving mirror for use with a single image sensor. The cited device requires that the camera is synchronized with the moving mirror. Furthermore, the cited device produces the two images in a time sequence.

The international application discloses a device having two independant mirror pairs, where a mirror of the first pair is placed adjacent to a mirror of the second pair, and both adjacent to the camera optical axis. The invented device comprises a stationary geometrical and optical arrangement, simultanously yielding two different view fields into a single camera exposure.

The imaging is effected by at least a first pair (5, 6) and a second pair (7, 8) of mirrors, where the mirrors in each pair are facing one another and where the pairs are positioned on opposite sides of the optical axis of said camera (1), one mirror (5) of the first pair being fixedly positioned adjacent to one mirror (7) of the second pair, at an angle to said axis, whereby said selected portions are shown as respective mirror images in the respective mirror (5, 7) and two areas along the longitudinal direction of the container (3), optionally including one or both end faces, are imaged simultaneously by the camera (1).

Claim 1 has been amended to better distinguish the invention from the cited prior art.

Yours faithfull

Zacco Norway AS
